INTRODUCTION

The fifth triennial bottom trawl survey of the Gulf of Alaska was completed during the summer of 1996 by the Resource Assessment and Conservation Engineering (RACE) Division of the Alaska Fisheries Science Center (AFSC), Seattle, WA. The triennial groundfish surveys are designed to describe and monitor the distribution, abundance, and biological condition of the important groundfish stocks. Previous surveys in this series were conducted in 1984, 1987, 1990 and 1993.

Historically, the Gulf of Alaska has been an important fishing grounds for a variety of groundfish species including Pacific ocean perch (Sebastes alutus), walleye pollock (Theragra chalcogramma), Pacific cod (Gadus macrocephalus), Pacific halibut (Hippoglossus stenolepis), sablefish (Anoplopoma fimbria), rockfishes (Sebastes spp.) arrowtooth flounder (Atheresthes stomias), lingcod (Ophiodon elongatus), Atka mackerel (Pleurogrammus monopterygius) and several invertebrate groups including crabs, scallop and squid.

The Gulf of Alaska forms the northeastern border of the Pacific Ocean and is comprised of complex bathymetric features ranging from jagged mountainous pinnacles to flat muddy areas. The features provide a wide variety of habitats resulting in a complex ecosystem. The rugged bottom topography prevalent in many areas requires the use of roller gear for all bottom trawling operations. The 1996 Gulf of Alaska survey area included the entire continental shelf and upper portion of the continental slope, down to 500 m in bottom depth.

METHODS

The survey was conducted in four legs totaling 75 days, aboard three chartered commercial trawlers, the F/V Dominator, F/V Golden Dawn and F/V Vesteraalen from 18 May to 31 July 1996. Sampling began in the Islands of Four Mountains area (170° W long.) and continued east across the Gulf of Alaska over the continental shelf and upper continental slope in depths from 20 m to 479 m ending in Dixon Entrance ($133^{\circ} 25'W$ long., Figure 1). Sampling occurred at preselected stations. If the bottom conditions were unsuitable for trawling, alternate stations were chosen from a list of locations successfully completed during previous surveys. In addition to the standard survey, a short experiment was conducted to assess groundfish escapement under the footrope of the RACE survey trawl during leg 3 aboard the F/V Golden Dawn. The results of this experiment will be reported later in another report.

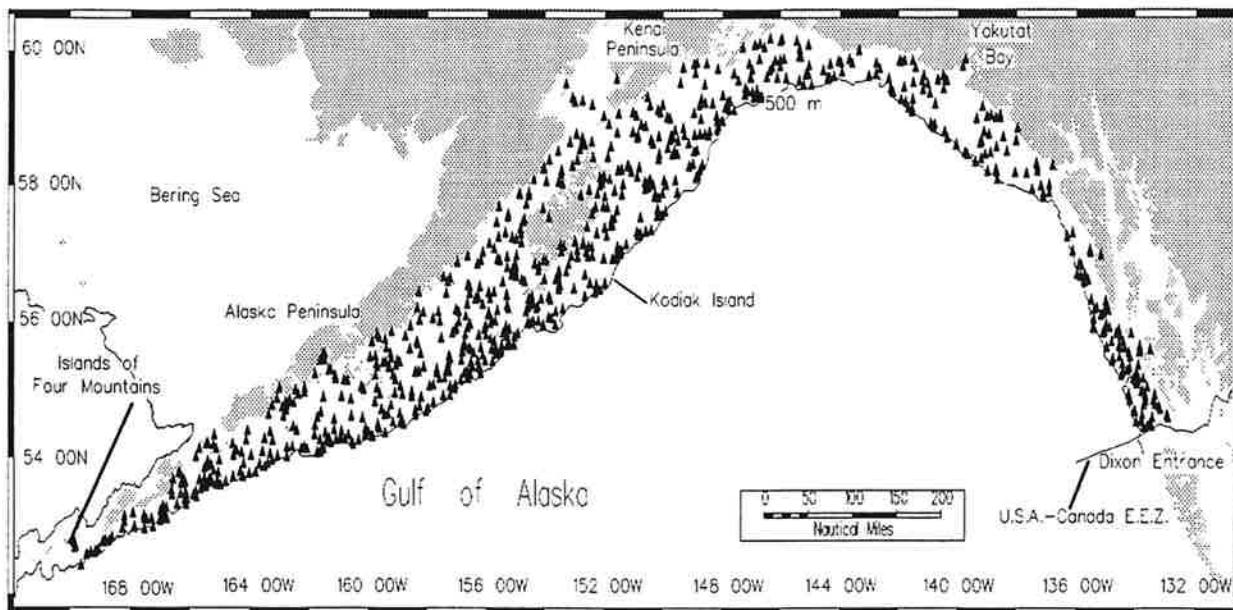

Figure 1. --All survey stations attempted during the NMFS triennial Gulf of Alaska bottom trawl survey, 18 May - 31 July 1996.

Vessels and Gear Characteristics

All three chartered vessels are house forward stern trawlers with two hydraulic net reels (one mounted over the stern ramp and one forward on the main deck), paired constant tension hydraulic trawl winches with steel cable from 1,280 m to 1,460 m in length and 2.54 cm in diameter, articulating hydraulic cranes for handling catches and gear and a single main diesel engine with a shrouded propeller. Each vessel's overall length (LOA) and continuous main engine power (HP) are 38.7 m LOA and 1,700 HP for the F/V Vesteraalen, 38.7 m LOA and 1,300 HP for the F/V Dominator, and 45 m LOA and 2,000 HP for the F/V Golden Dawn. The navigating equipment for both vessels includes Global Positioning Systems (GPS), Loran C receivers with converters for geodetic positions, Loran C video-plotters, 2 or more radars and auto pilots. Other electronics includes color video fish finders, depth profilers, single sideband and VHF radios.

All vessels used standard RACE Division poly-Nor'easterly high opening bottom trawls rigged with roller gear (Appendix). The headrope consists of a 27.2 m (89 ft-1 inch), 1.3 cm (1/2 in) 6 X 19 gauge galvanized wire rope, wrapped with 1 cm (3/8 in) 3-strand polypropylene rope, strung with 21, 30 cm (12 in) diameter floats. The "fishing line" is composed of longlink alloy chain

24.7 m (81 ft) long and 1.3 cm (1/2 in) in diameter. The footrope is 24.9 m (81 ft-7 in) in length, 1 cr (3/8 in) in diameter 6 X 19 gauge galvanized wire rope wrapped with polypropylene rope. The roller gear is 24.2 m (79 ft-6 in) long and utilizes 1.9 cm (3/4 in) diameter, 6 X 19 gauge galvanized wire rope strung through 10.2 cm (4 in) diameter rubber disks separating 16 35.6 cm (14 in) diameter rubber wing bobbins. Each lower wing is replaced with extensions ("flying wings"), wire rope 5.9 m (19 ft-6 in) long and 1.91 cm (3/4 in) diameter threaded through 20 cm and 10 cm (8 in and 4 in) rubber disks. Trawls are constructed of 4 and 5 mm polyethylene twines stretched to yield a 12.7 cm (5 in) diameter mesh. The codend is 105 open meshes in circumference and 100 meshes deep. Codend meshes are of double bar construction stretched to 8.9 cm (3 1/2 in) in diameter and use 4 mm twine. The codend liner is 315 meshes in circumference and 200 meshes deep and meshes are stretched to a diameter of 3.2 cm (1 1/4 in) and use 18 nylon twine. Net accessory gear includes 54.9 m (180 ft) long, 1.6 cm (5/8 in) diameter galvanized triple dandy lines rigged with chain extensions connected to the headrope (45.7 cm (18 in)) and side panels (22.9 cm (9 in)). Trawl doors were steel V type and measured 1.8 m X 2.7 m (6 X 9 ft) and weighed approximately 800 kg (1,800 lb) each.

A SCANMAR¹ net mensuration system consisting of a headrope unit and two wing units acoustically linked to the vessels data recording system was used to measure the distance between the net's wingtips and the distance between the headrope and footrope at most stations attempted by each vessel. The net opening tended to increase horizontally (and decrease vertically) with depth due to the increased amount of deployed trawl cable (trawl warp). Preliminary results indicate an approximate average opening width of 16 m and height of 5.5 m. The average towing speed of each vessel was approximately 3 nautical miles per hour.

Survey Design and Operations

The triennial survey design employed a stratified random sampling pattern consistent with previous triennial surveys. The Gulf of Alaska was divided into 49 strata categorized by depth interval, type of geographical area (e.g. banks, gullies and slopes) and International North Pacific Fisheries Commission statistical areas. Depth intervals were defined as less than 100 m, 101-200 m, 201-300 m and 301-500 m. Station locations were allocated for each stratum from a grid of points laid over the

¹Reference to trade names does not imply endorsement by the National Marine Fisheries Service, NOAA.

survey area. Within each stratum the sampling density was assigned based on expected variances of abundances for selected species from past surveys. After the number of stations were determined for each stratum, a corresponding number of grid points were chosen randomly. Stations were prioritized within each stratum to provide three potential levels of sampling density. Station prioritization was required due to the unpredictability of trawling, weather, mechanical breakdown, etc. Priority One stations were always expected to be sampled. Priority Two and Three stations were expected to be selected according to the prevailing rate of successful station sampling, remaining survey time available and number of stations remaining. Sampling was limited to depths less than 500 m.

During survey operations, the first trawlable location encountered near the selected station was sampled. In choosing the exact location, only the bottom conditions indicated by the echo sounder were considered and not the presence or absence of fish sign. Tow duration was one-quarter hour, half the duration used in previous surveys. The duration was reduced in part to decrease the proportion of large catches which require subsampling. In cases where there was not enough trawlable bottom for a full one-quarter hour tow, shorter tows were completed. Attempts were made to maintain constant bottom depths, trawl wing spread and towing speeds. However when depths changed, the trawl warp was adjusted to maintain wing spread. Bottom contact was monitored through the use of a RACE Division bottom contact sensor at most stations. The duration of sampling on the sea bottom was determined during trawling operations with the net mensuration system. Later the duration estimate was refined using measurements from a depth and time sensor mounted on the trawl.

Catches weighing less than approximately 1,000 kg were completely sorted to species and weighed. Larger catches were sampled to obtain a representative portion of approximately 1,000 kg. The numbers of individuals for each species were determined from the total catch or from random samples. Additional biological data collected included fish lengths and weights, age structure, sexual maturities and special collections of stomachs, tissues, whole fish and invertebrates. Length data were collected using barcode input devices and individual fish weight data was collected using a Marel motion compensated electronic scale.

Oceanographic data collected at all stations included water temperature profiles and additional sea surface temperatures using calibrated bucket thermometers. A more detailed account of survey sampling methodology, list of species names, relative abundance and biomass estimates of the major groundfish species will appear in a Gulf of Alaska Triennial Survey Data Report.

RESULTS

Sampling proceeded from the Islands of Four Mountains to the Canadian border at Dixon Entrance, in depths ranging from 20 to 479 m. Successful trawls were completed at 807 of the 868 stations attempted, a 4% increase over the 1993 triennial Gulf of Alaska Survey. Minimal time was lost to bad weather and gear repair.

Priority One stations were always sampled along with most priority Two and Three stations. Some sampling strata were poorly sampled, due primarily to untrawlable bathymetric features, or preemption by commercial fishing gear. The catch comprised more than 500 species of fish and invertebrates. The dominant fish species are ranked by catch weight in Table 1, expressed as kilograms of catch for each of the five management areas. Highest in total catch abundance were arrowtooth flounder, Pacific ocean perch, walleye pollock, Pacific cod and Pacific halibut. Catch abundance was generally highest in the Kodiak and Chirikof areas (159° W long to 147° W long., central gulf), lower in the Shumagin area (170° W long. to 159° W long., western gulf) and lowest in the Yakutat and Southeastern areas (147° W long. to $133^{\circ} 25'W$ long., eastern gulf), and is related to the quantity of suitable habitat and trawlable area. In the central and western areas, which have a large relatively flat shelf and extensive system of gullies, the catch by species was predominantly composed of Pacific ocean perch, arrowtooth flounder, walleye pollock, Pacific cod and flatfish. The hard rugged topography of the eastern gulf provided favorable habitat for many rockfish species and lingcod. Atka mackerel was third in abundance in the western gulf due primarily to a single catch. Deepwater fish species, and all invertebrates were not adequately assessed primarily due to the survey's 500 m depth range restriction and use of roller gear on the footrope. Deepwater fish included sablefish, shortspine thornyhead (Sebastolobus alascanus), shortraker rockfish (Sebastodes borealis) and grenadier species.

The biological data collected included length measurements from over 262,000 fish representing 67 species including 23 rockfish, 17 flatfish and 10 elasmobranchs. Specimen data were collected from 63 species of fish and red squid (Berryteuthis magister). The specimen data collection includes 16,224 age structures, 16,095 weight measurements, 317 sexual maturity observations and gonad weights, 1,000 whole fish and over 2,450 stomach samples. Stomachs were collected from arrowtooth flounder, Pacific cod, walleye pollock and Pacific halibut for a trophic interaction study. Sea surface temperatures were collected at 781 survey stations and ranged from 4.2°C to 16.1°C .

Sea bottom temperatures were taken from 771 stations and ranged from 3.2°C to 11.7°C.

ORGANIZATION OF REPORT AND DATA STANDARDIZATIONS

The purpose of this report is to provide the fishing industry with pertinent catch information collected by the survey vessels and focuses on data collected at individual stations for the principal species encountered during the survey. The fishing results are presented in Section 1 for the F/V Dominator, Section 2 for the F/V Golden Dawn, and Section 3 for the F/V Vesteraalen. Each section has three parts: (1) station charts with haul numbers plotted adjacent to their respective geographical locations, (2) summary listings of species catches by haul, and (3) summary listings of catch rates in descending order of magnitude for selected species of commercial interest. The summary listings of catch rates groups all sharks, skates and octopus, rock sole sp. groups Lepidopsetta bilineata and an undescribed Lepidopsetta species, and dusky rockfish sp. groups Sebastes ciliatus and an undescribed Sebastes species. Hauls which had no catch are omitted from the listings. Explanations of the symbols and codes appearing in the fishing logs are summarized in Table 2.

Section 2

Fishing Log for the F/V Golden Dawn

- Station charts of haul numbers plotted adjacent to their respective geographical positions

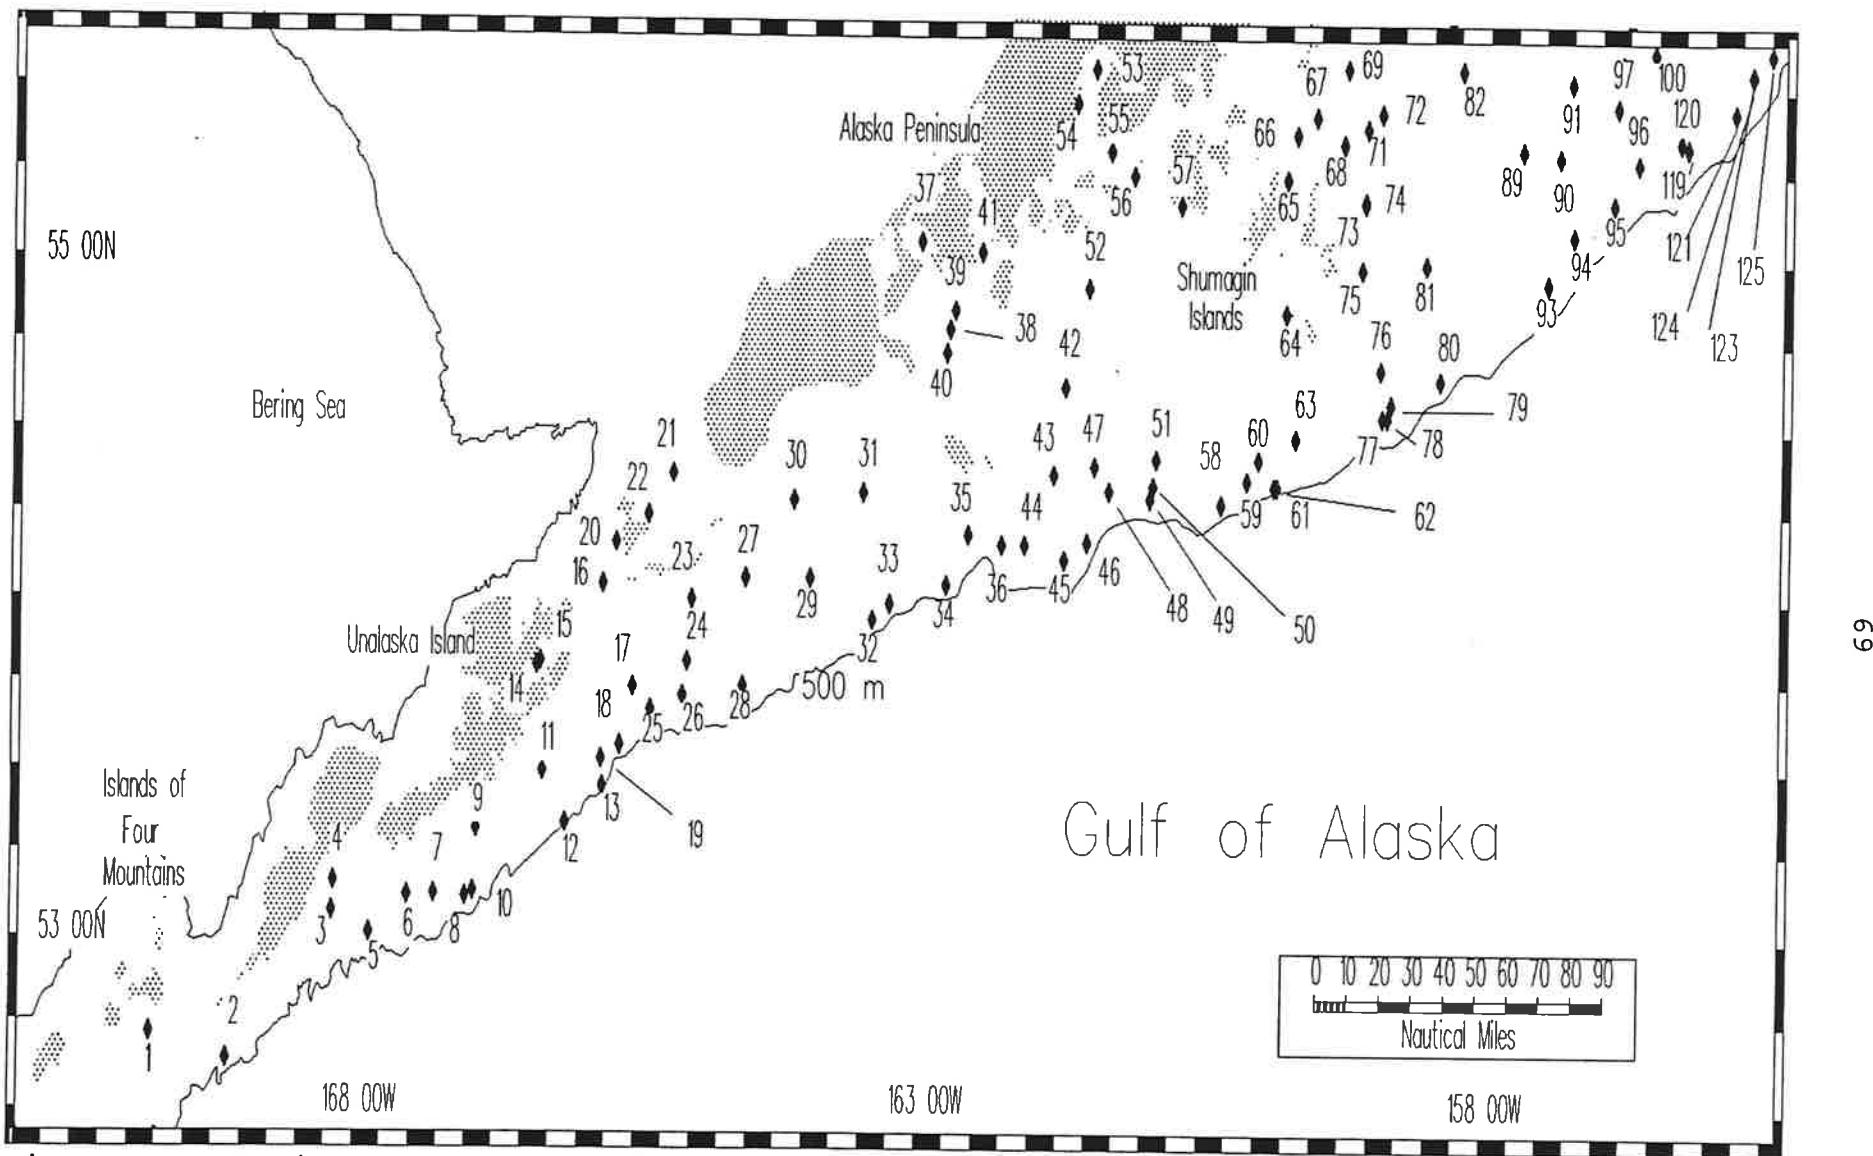

Figure 7.--Stations surveyed by the chartered trawler F/V Golden Dawn from the Islands of Four Mountains to the Shumagin Islands area (hauls 1-69, 71-82, 89-91, 93-97, 100, 119-121, 123-125).

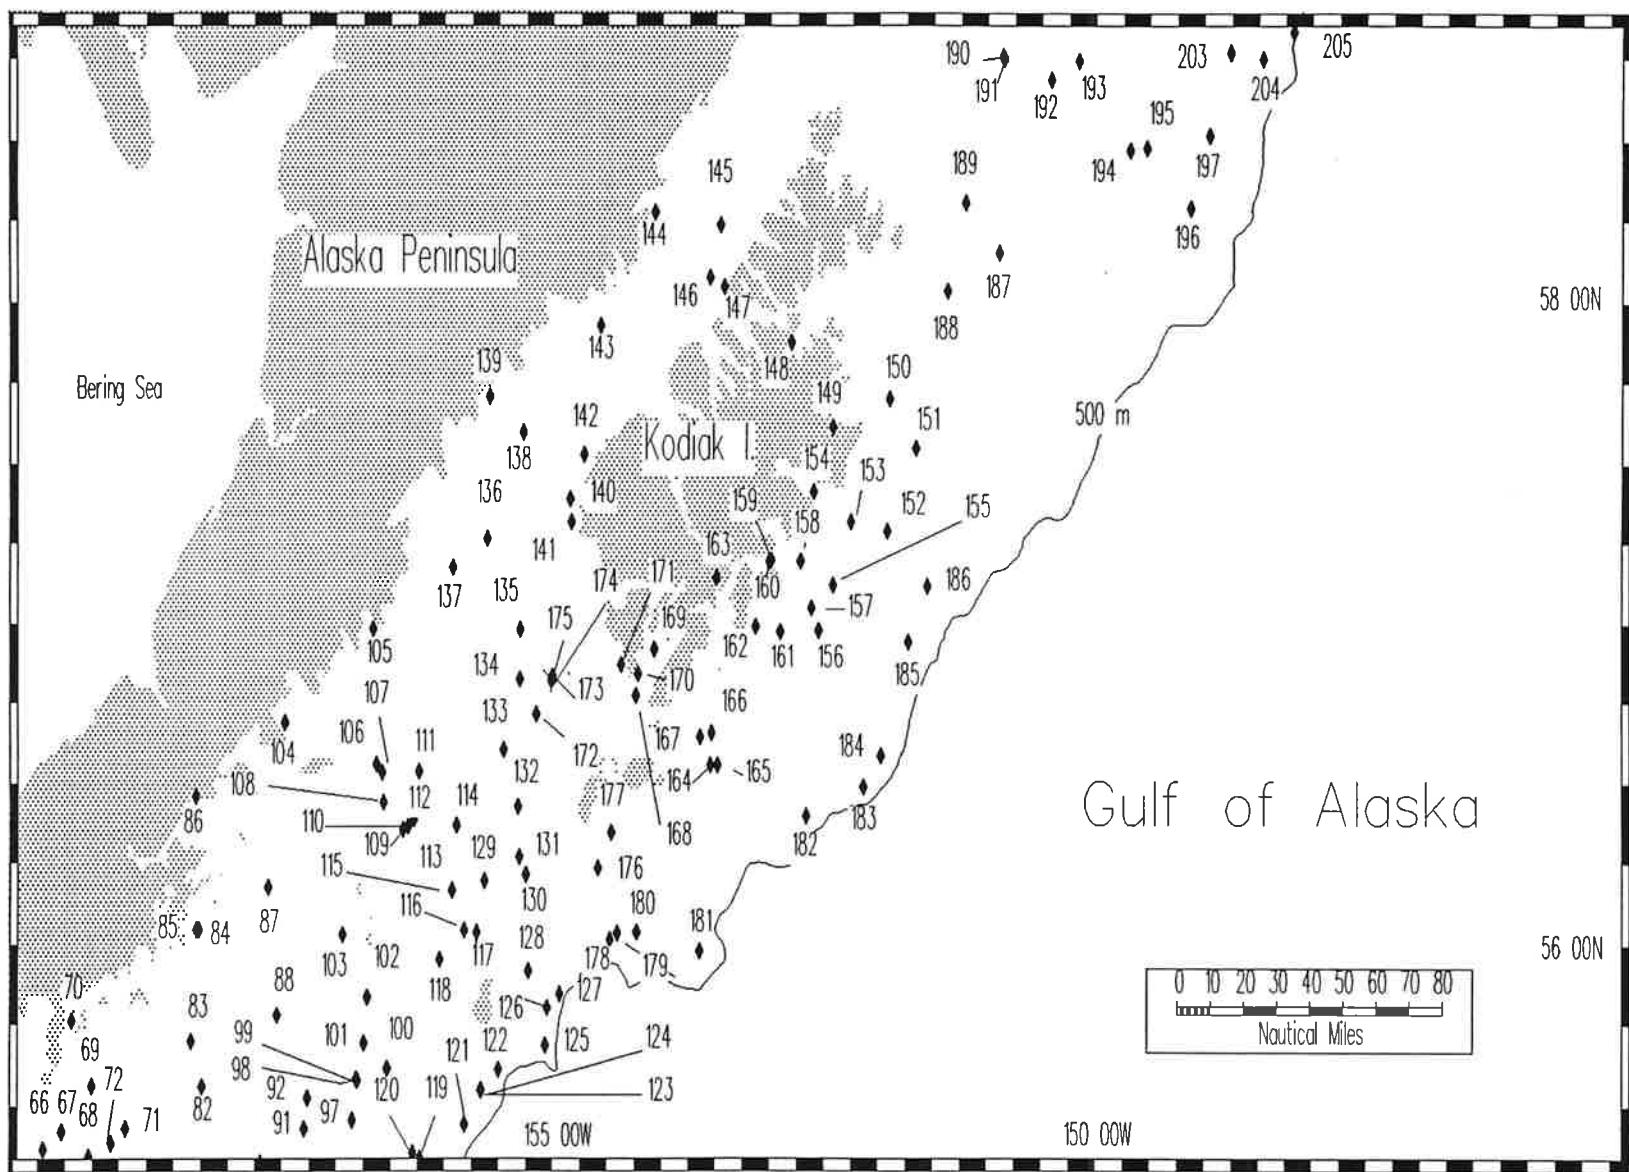

Figure 8.--Stations surveyed by the chartered trawler F/V Golden Dawn in the Kodiak Island area (hauls 66-72, 82-88, 91, 92, 97-197, 203-205).

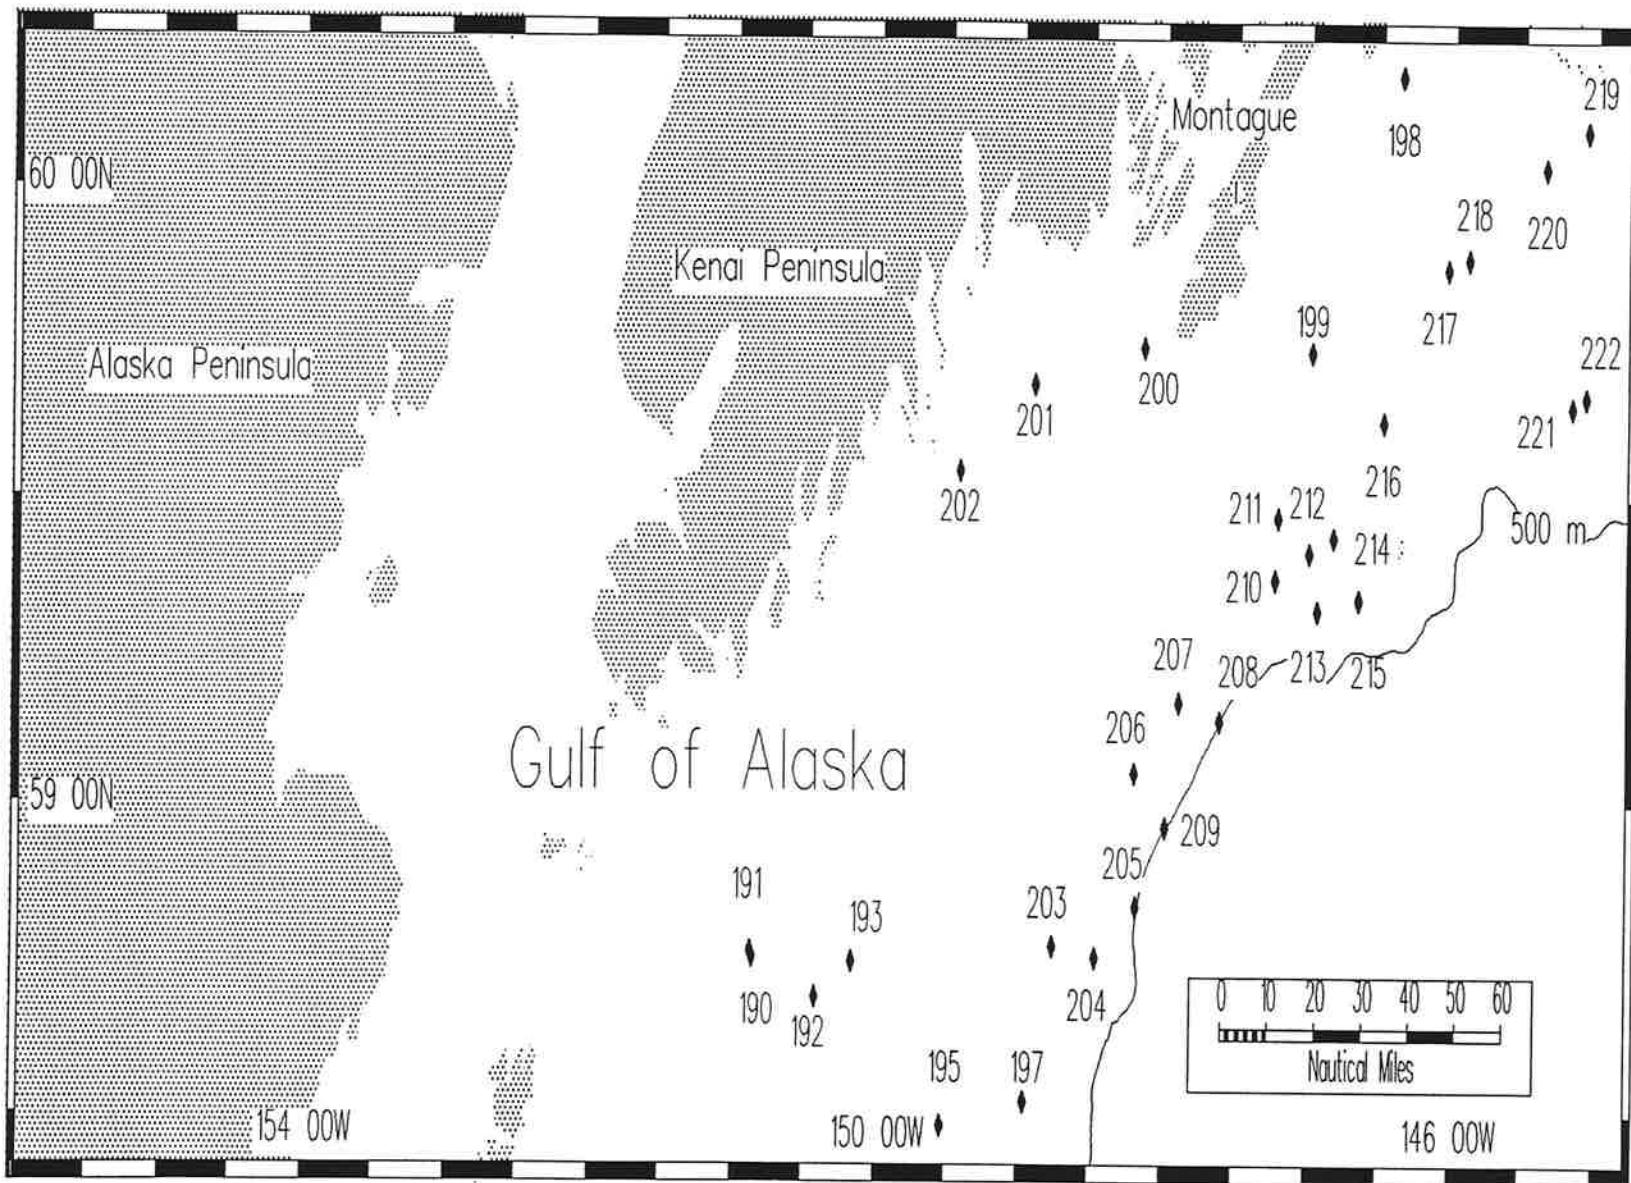

Figure 9.--Stations surveyed by the chartered trawler F/V Golden Dawn from the Alaska Peninsula to Montague Island (hauls 190-193, 195, 197-222).

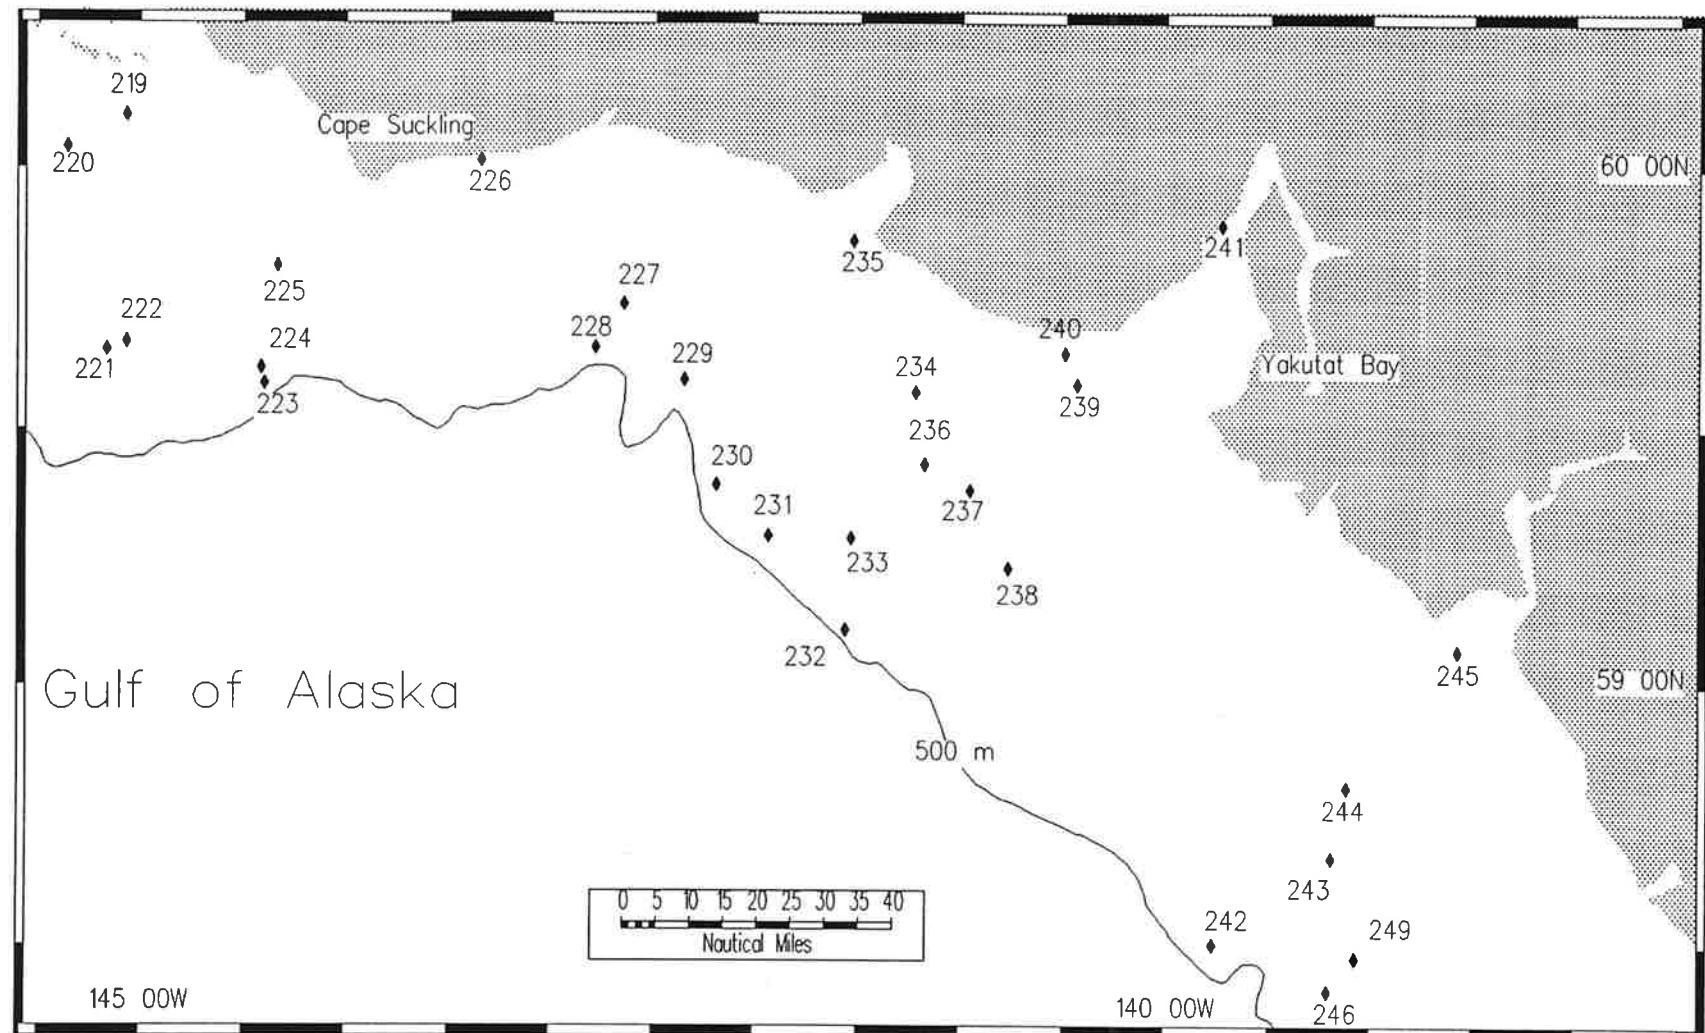

Figure 10.--Stations surveyed by the chartered trawler F/V Golden Dawn from Cape Suckling to Yakutat Bay (hauls 219-246, 249).

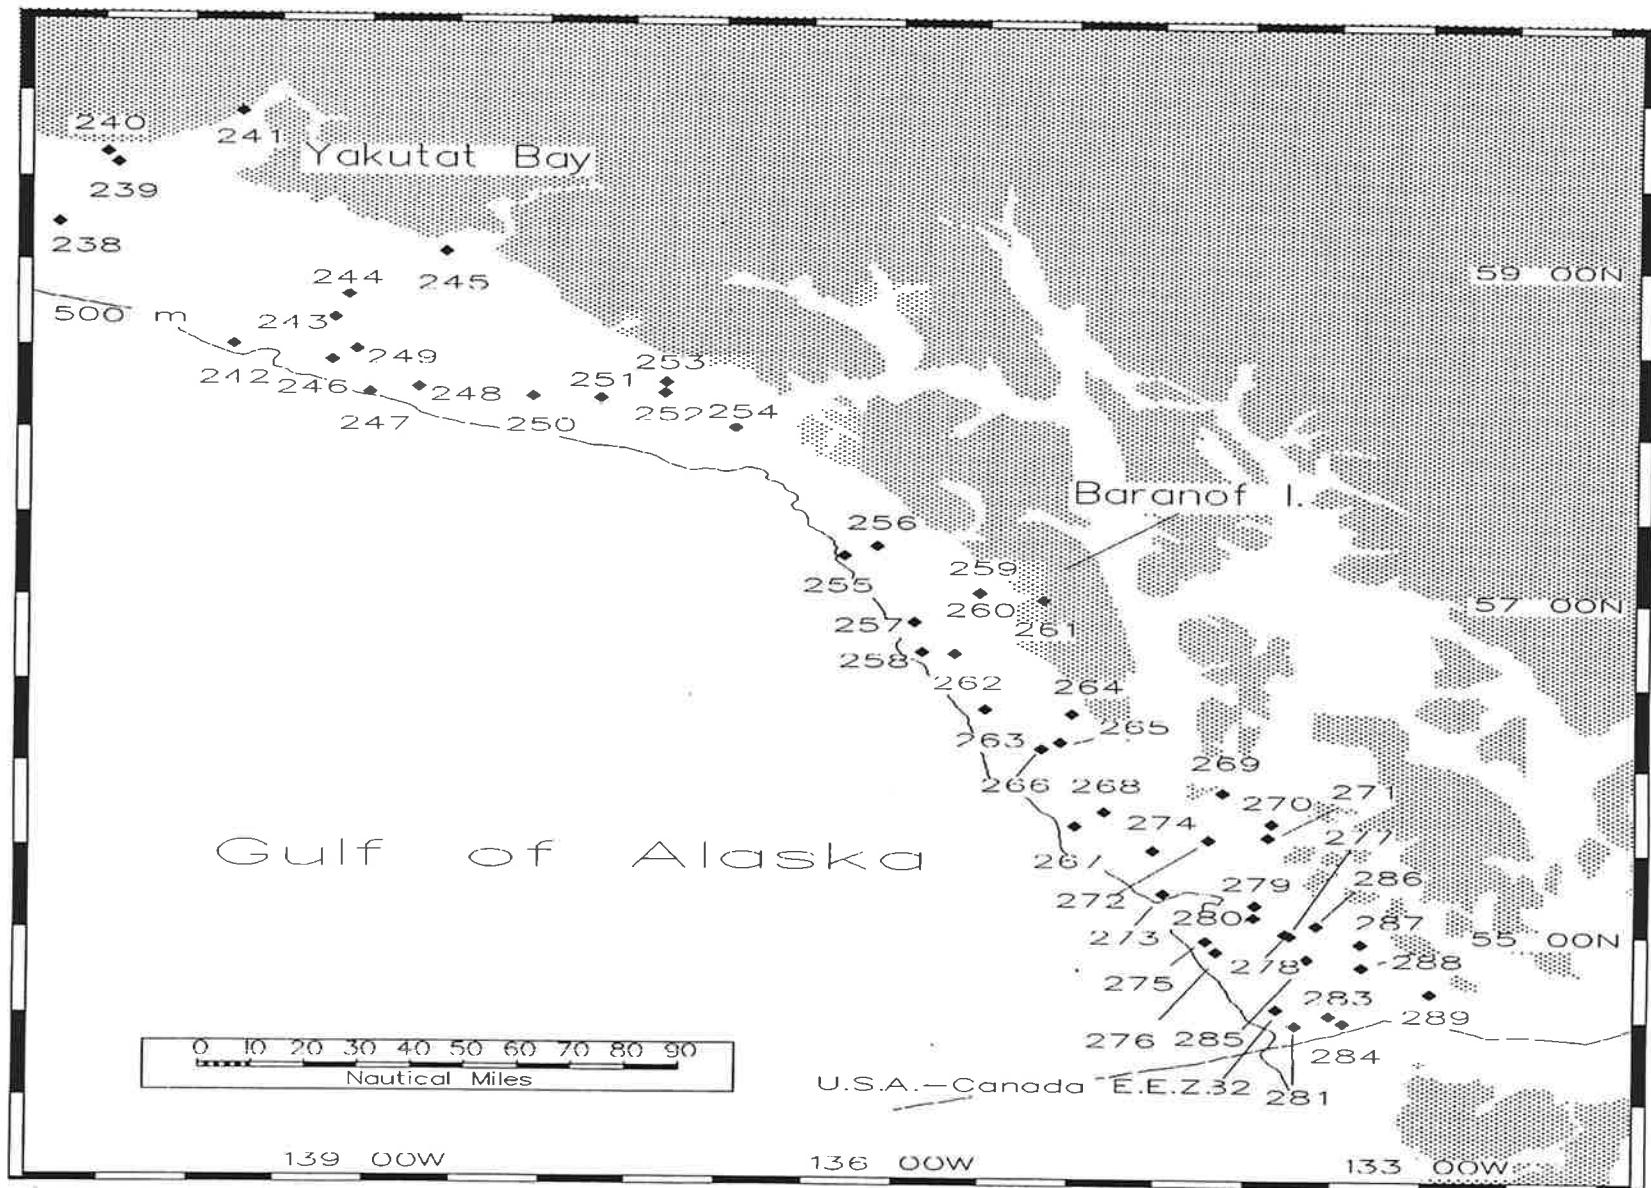

Figure 11.--Stations surveyed by the chartered trawler F/V Golden Dawn from Yakutat Bay to Dixon Entrance (hauls 238-289).

Section 2 (continued)

Fishing Log for the F/V Golden Dawn

- Summary listings of species catches by haul

- Haul start latitude and longitude
- Bottom depth in meters
- Duration of tow in hundredths of an hour
- Distance fished in nautical miles
- Catch weight in kilograms of principal species
- Total catch weight in kilograms of all species

Section 3

Fishing Log for the F/V Vesteraalen

- Station charts of haul numbers plotted adjacent to their respective geographical positions

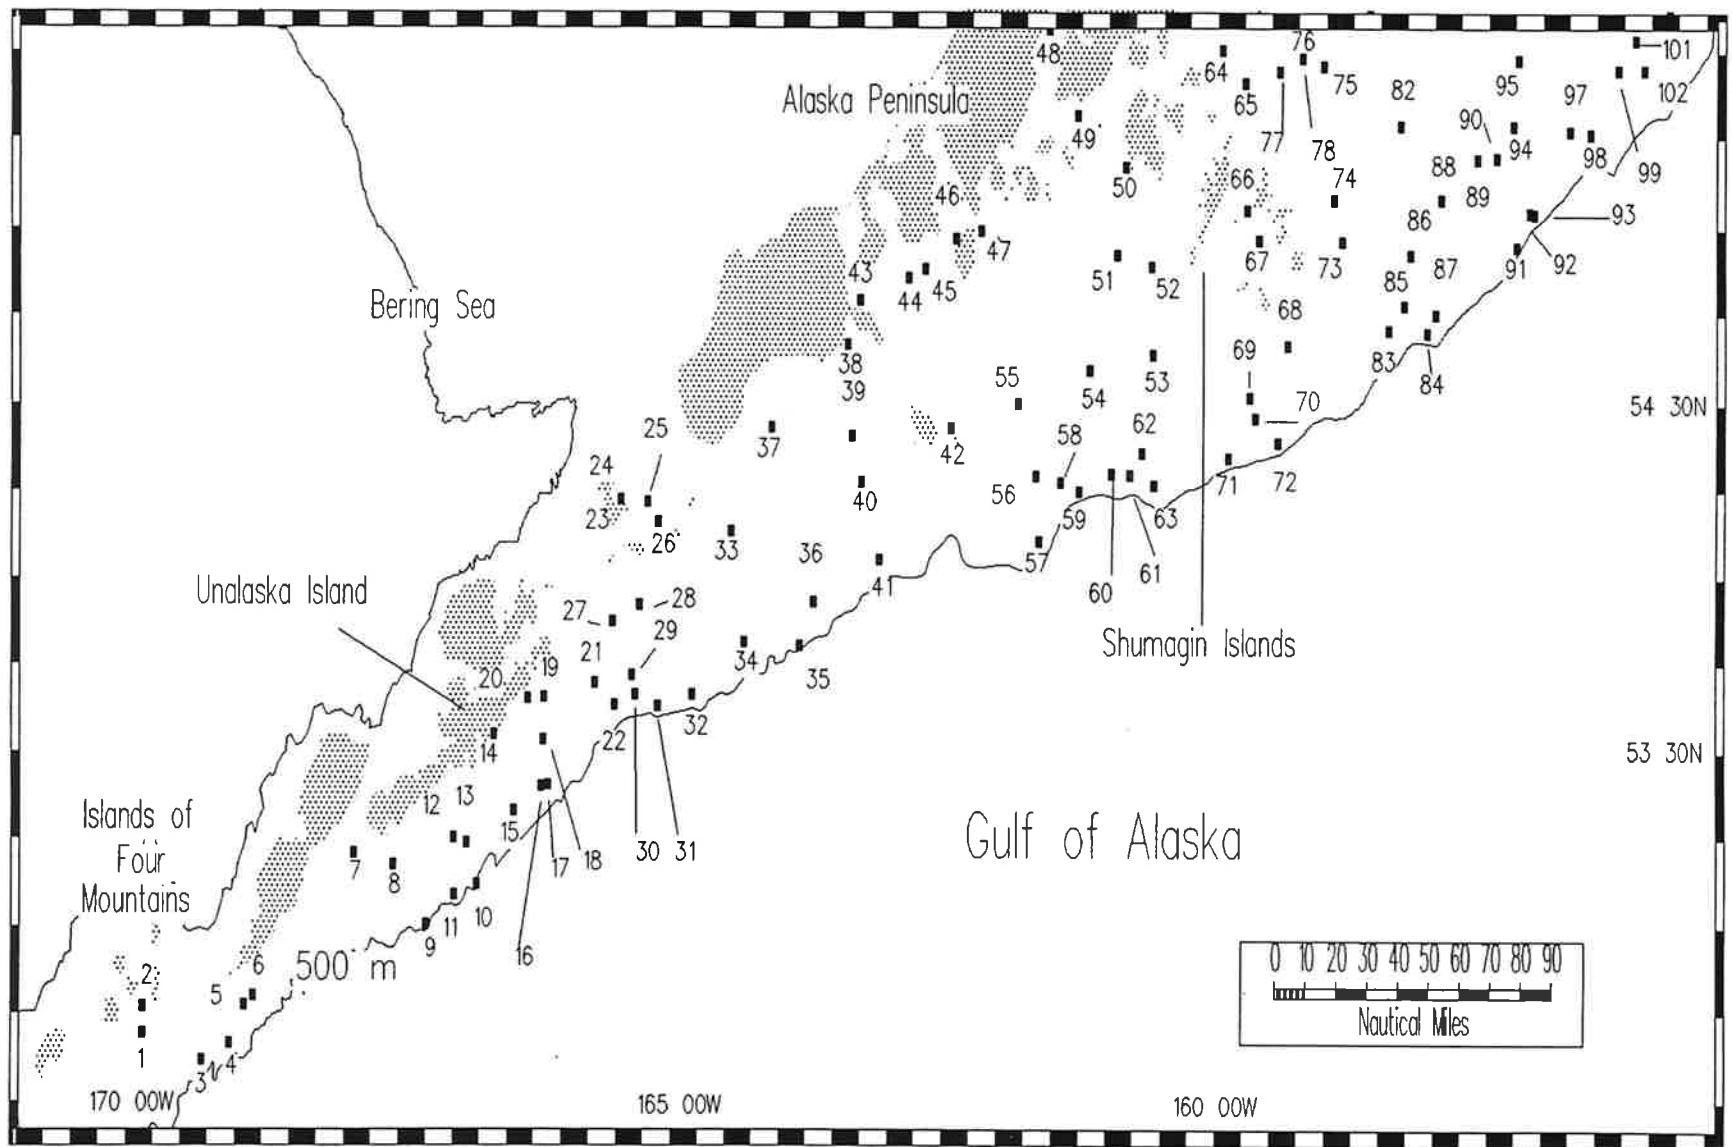

Figure 12.--Stations surveyed by the chartered trawler F/V Vesteraalen from the Islands of Four Mountains to the Shumagin Islands (hauls 1-78, 82-95, 97-99, 101, 102).

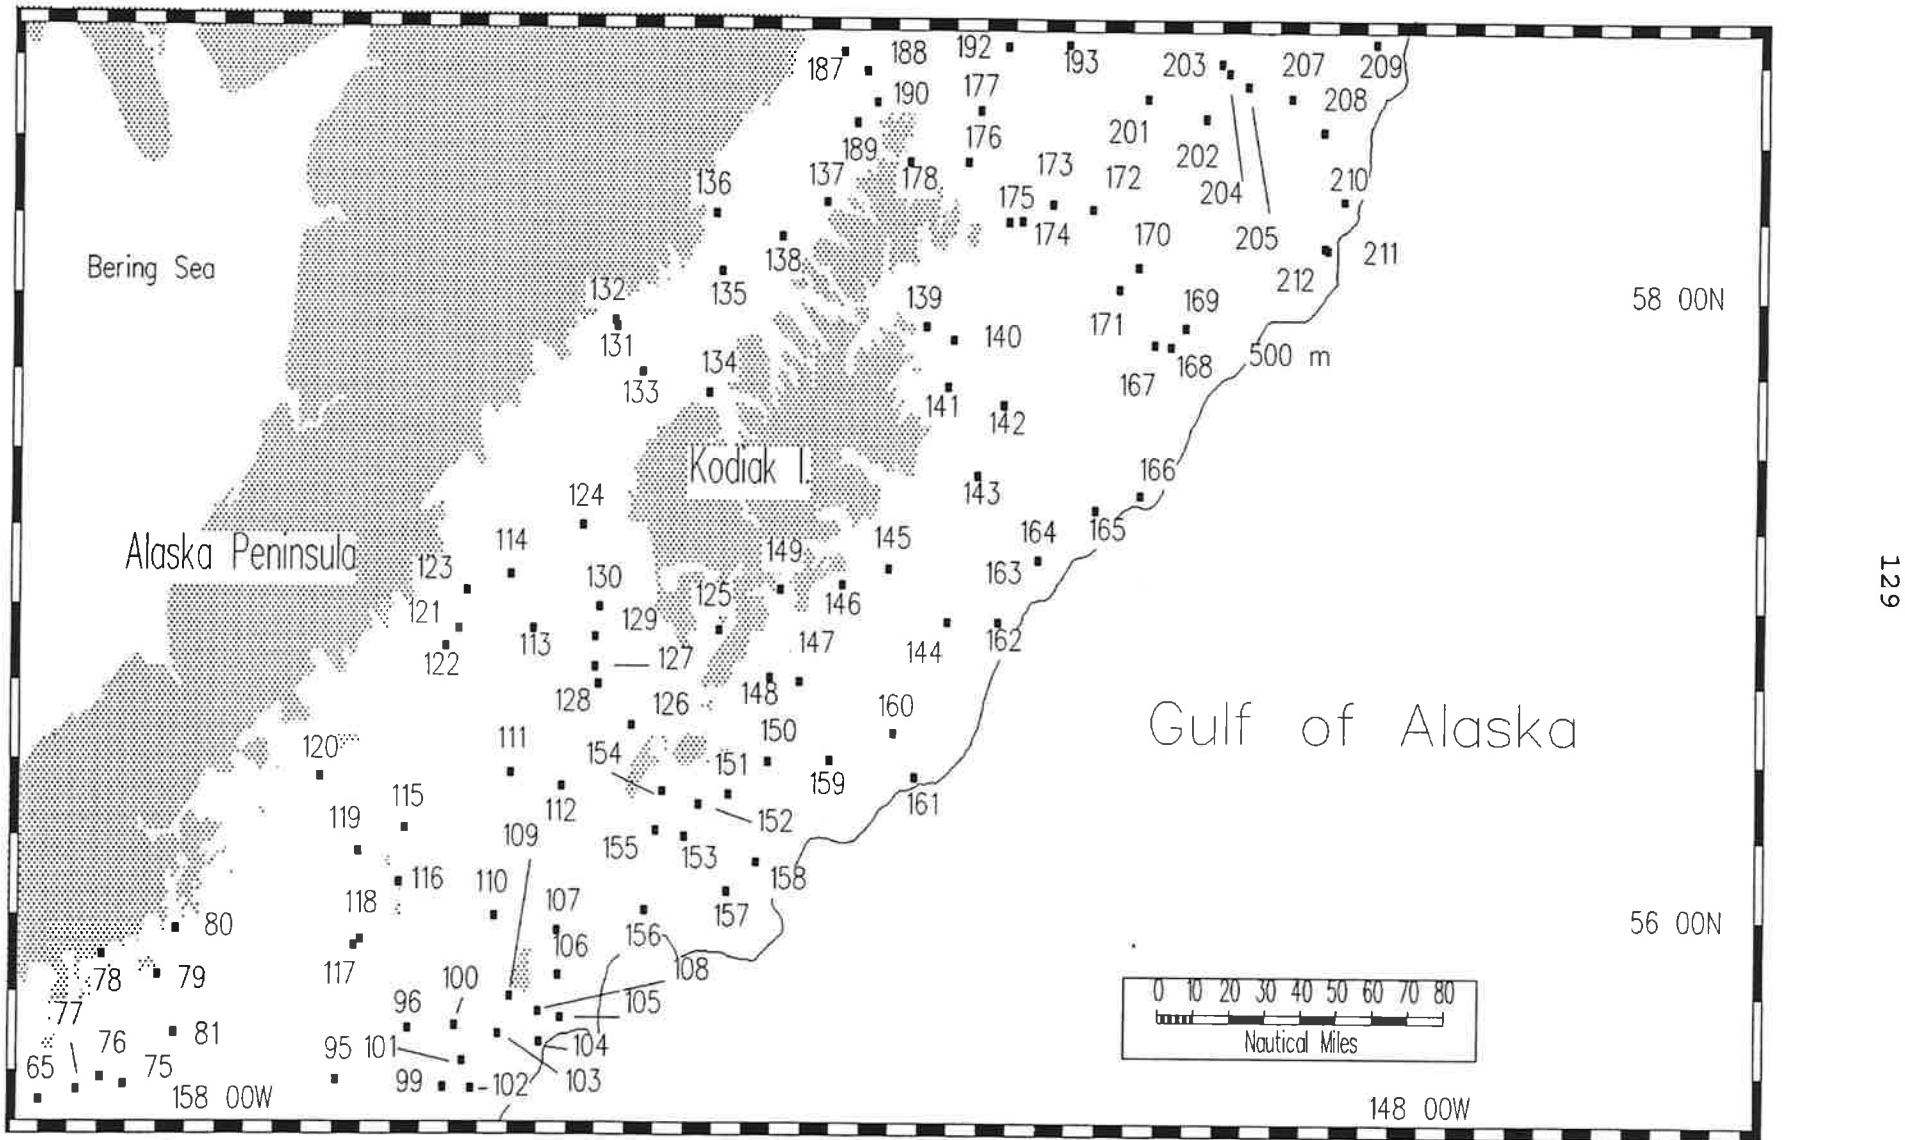

Figure 13.--Stations surveyed by the chartered trawler F/V Vesteraalen in the Kodiak Island area (hauls 65, 75-81, 95, 96, 99-178, 187-190, 192, 193, 201-205, 207-212).

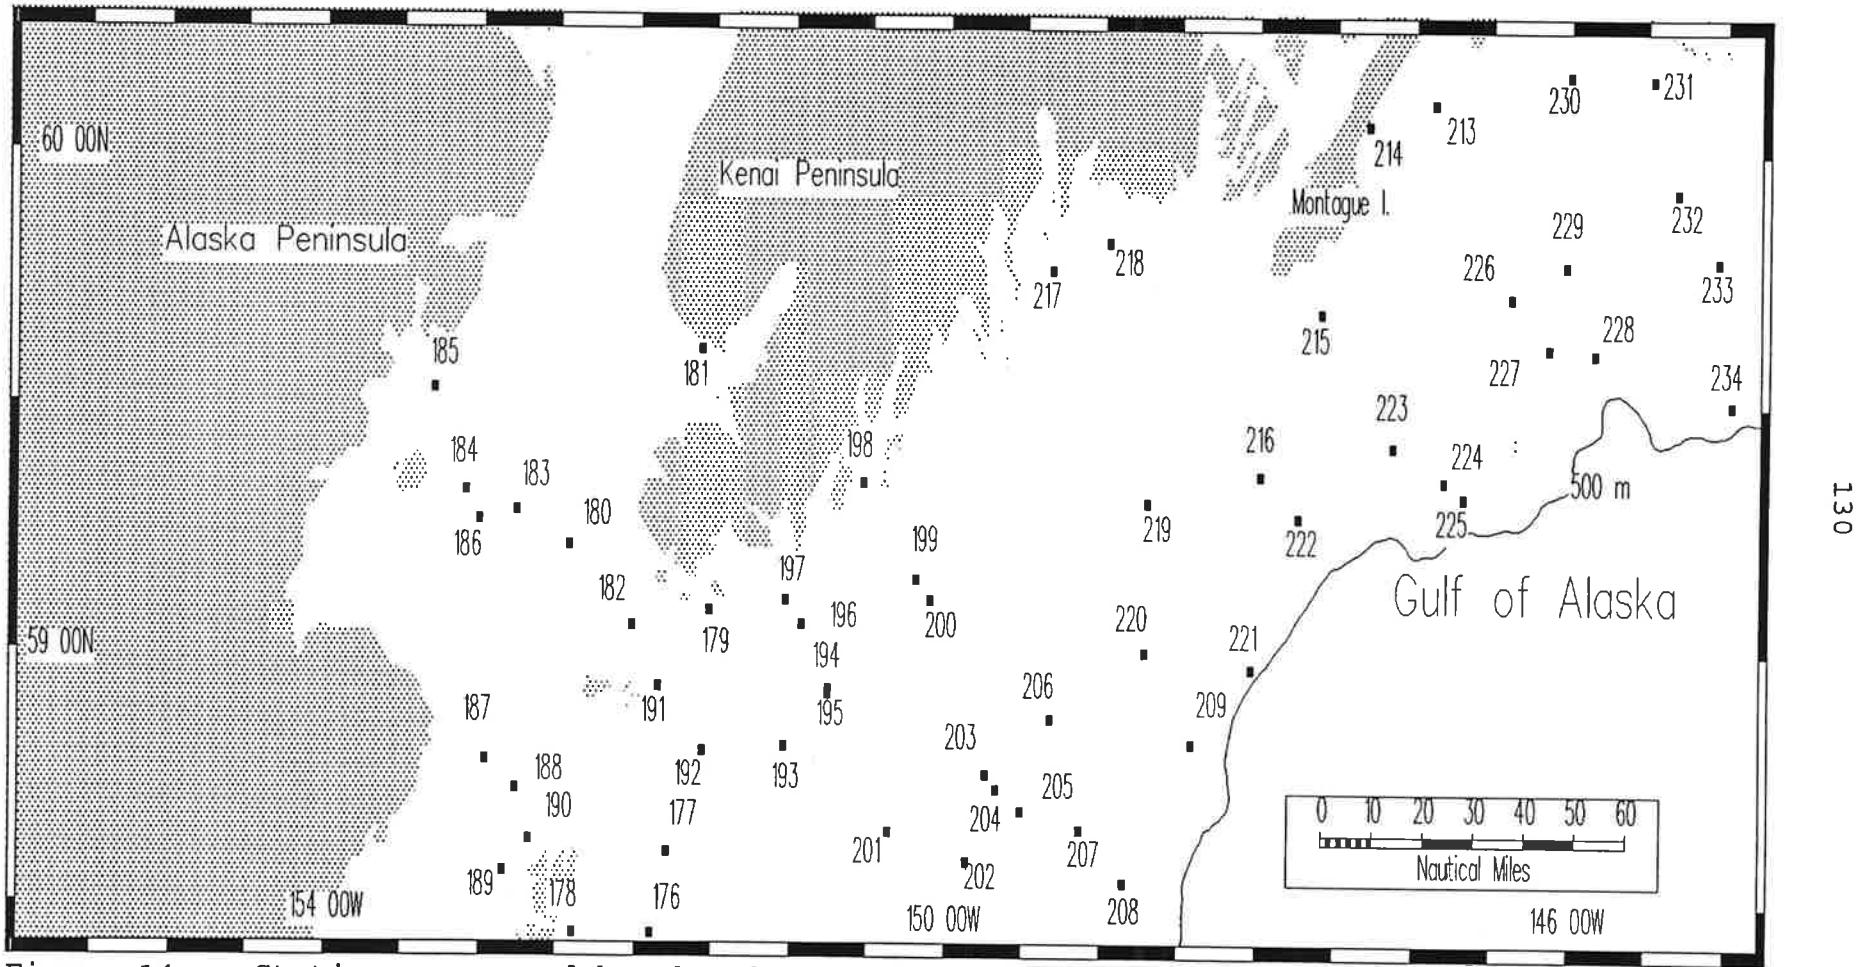

Figure 14---Stations surveyed by the chartered trawler F/V Vesteraalen from the Alaska Peninsula to Montague Island (hauls 176-209, 213-234).

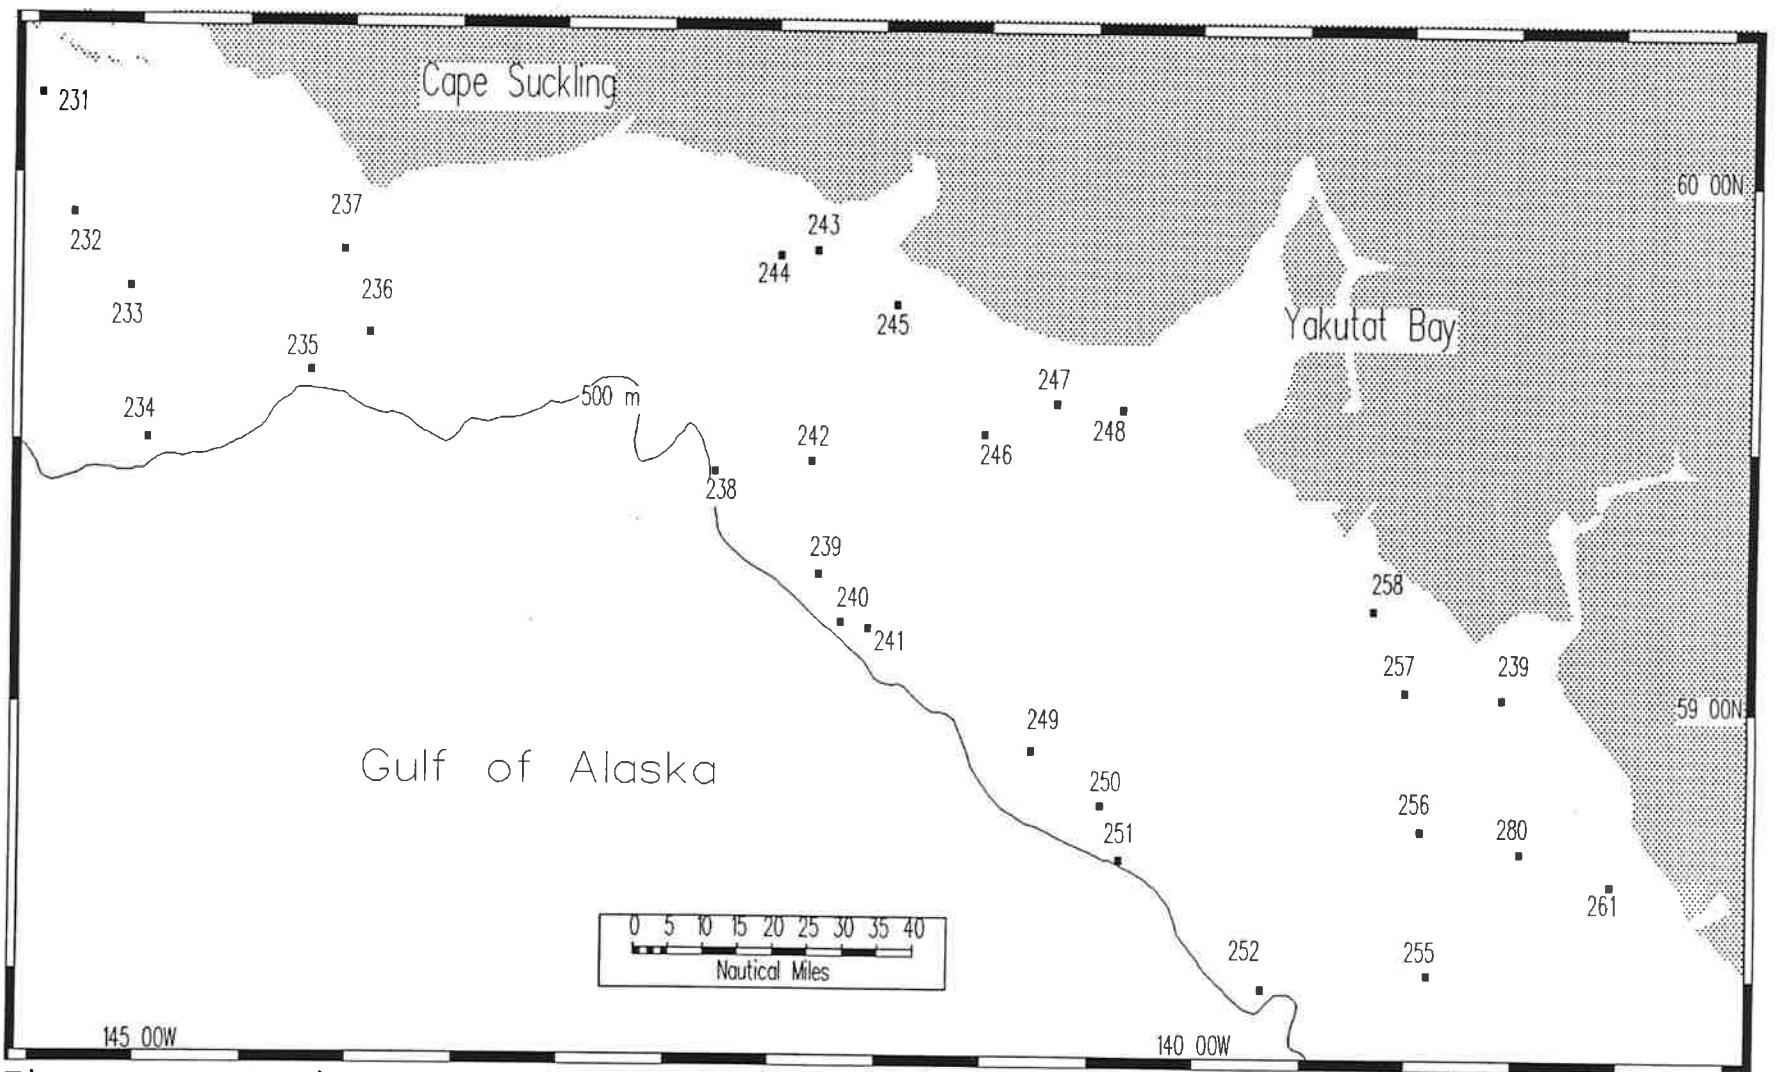

Figure 15.--Stations surveyed by the chartered trawler F/V Vesteraalen from Cape Suckling to Yakutat Bay (hauls 231-252, 255-261).

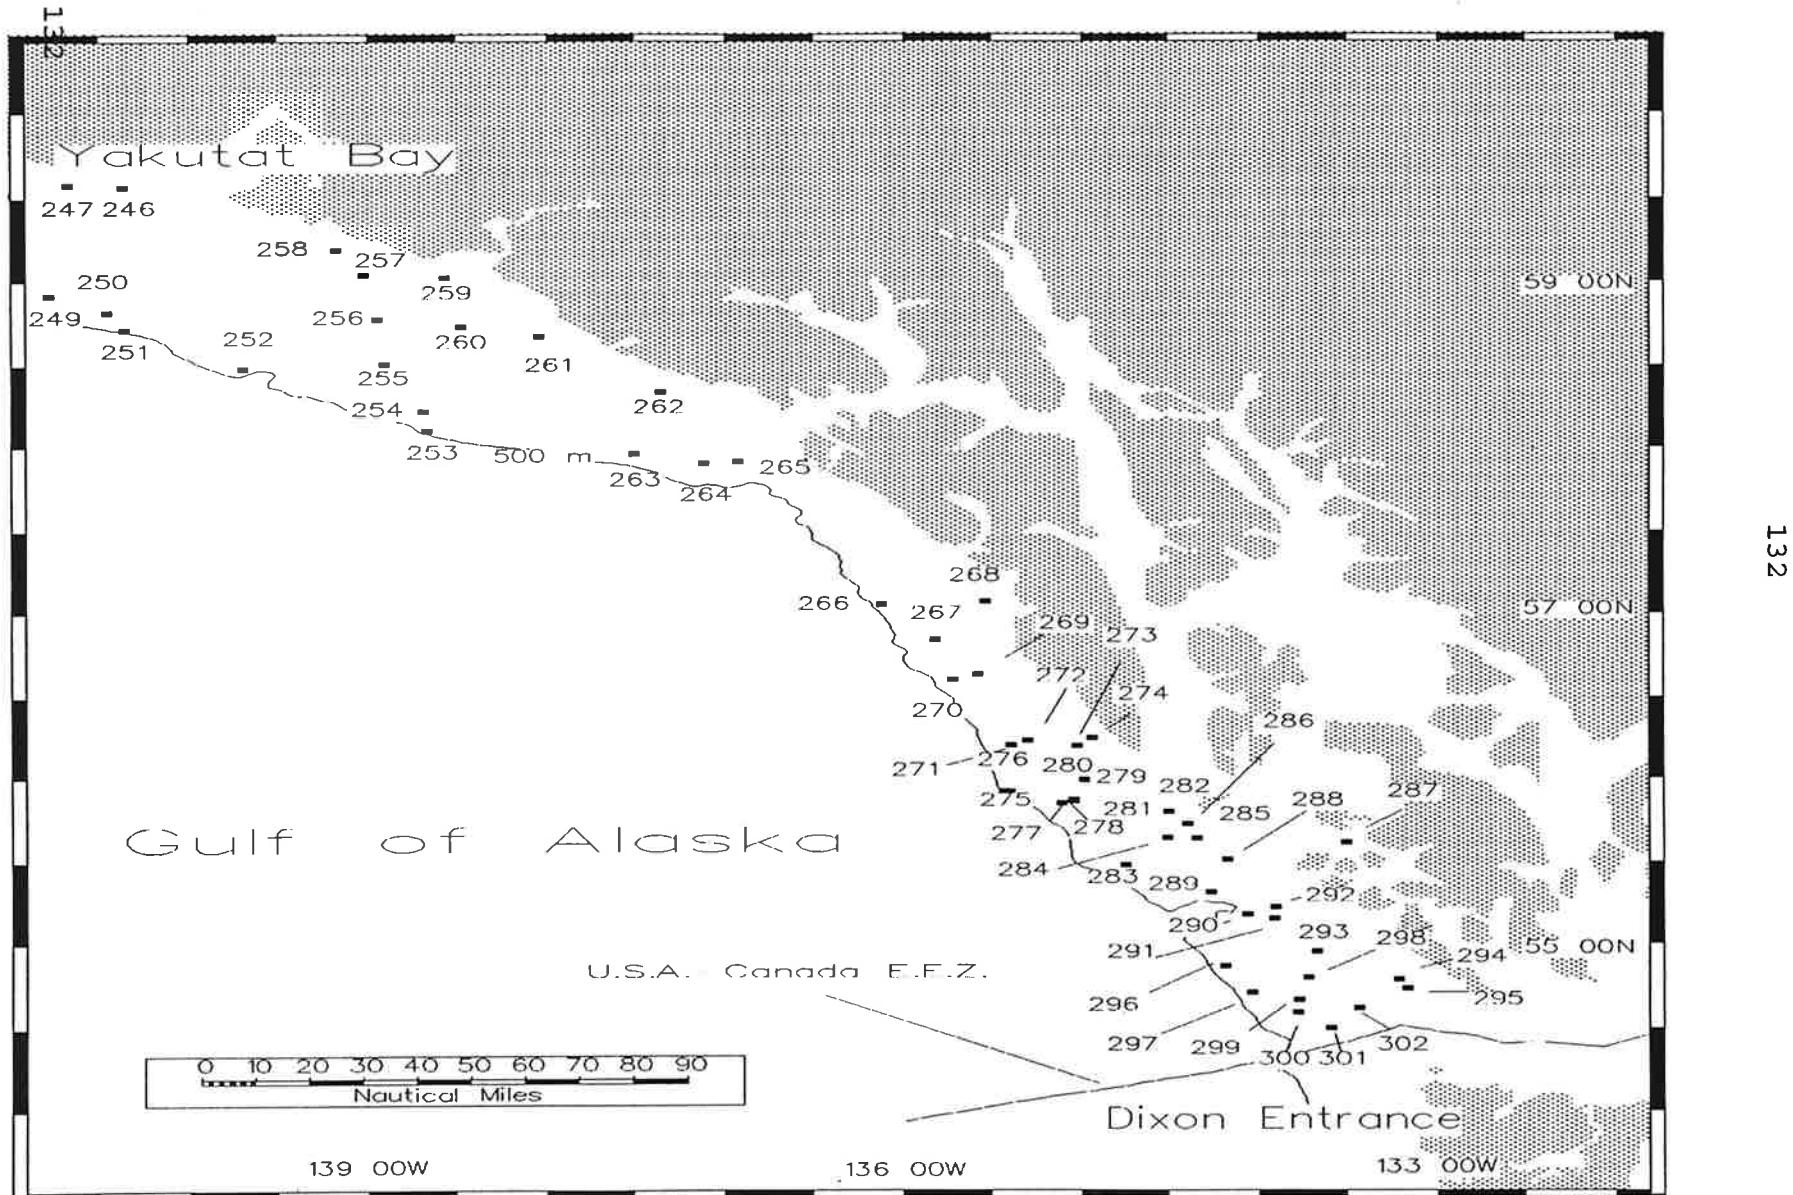

Figure 16.--Stations surveyed by the chartered trawler F/V Vesteraalen from Yakutat Bay to Dixon Entrance (hauls 246, 247, 249-302).

Section 3 (continued)

Fishing Log for the F/V Vesteraalen

- Summary listings of species catches by haul

- Haul start latitude and longitude
- Bottom depth in meters
- Duration of tow in hundredths of an hour
- Distance fished in nautical miles
- Catch weight in kilograms of principal species
- Total catch weight in kilograms of all species

1996 Triennial NMFS Gulf of Alaska bottom trawl survey by the chartered F/V Vesteraalen
